Super Pro

In the early '90's we decided to concentrate on our specialisation of gas catalytic technology, and in 1994 launched the tool which changed "the rules", fuelled our growth. and has affected our developments ever since.

It's been described as "wildly overpowered", and perhaps 125 watts is a bit much for most soldering tasks. You don't drive your car at full power all the time ... do you?. But it's nice to know it's there!

Soldering, hot air, flame (no tip required), hot knife; the kit gives the full functional range. The application range is only limited by your imagination, and enhanced by tackling that next awkward job.

With the stainless steel tank finish, this tool can hold its head up in anyone's tool-box. Without naming names we can assure you it moves in the best of company (and Companies).

Ten tip types available (flame requires no tip) plus hot air deflector. Average run time per fill, 90 minutes +. Piezo ignition built-in.
